RESPONSE

Hon. Commissioner of Patents and Trademarks  
Washington, D.C. 20231

Sir:

In response to the Office Action dated May 21, 1991,  
applicant hereby responds as follows.

The invention is directed to an improvement in computers/processors (for example, the type of processor embodied in the Intel 80486 micro-processor). Such micro-processors include, among other things, "custom" logic elements in addition to memory elements. The concept of the present invention is to select "on the fly" those random logic elements which are the most efficient in performing a particular instruction. This of course requires that the connection among the custom logic elements be reconfigurable on the fly to enable such a selection.

For this purpose, the preferred embodiment of the invention employs optical elements to reconfigure the random logic elements in accordance with the selections made. (In the preferred embodiment of the invention, speed is enhanced by using the vertical dimension of the VLSI chip for
